The TSRP-150-90-37 radio frequency two-way amplifier is mainly used in areas where the base station signal is too weak, as a relay station. The radio frequency two-way amplifier amplifies the base station signal, and then transmits it to the area with too weak signal to expand the coverage of the base station. It is a duplex amplifier with two-way transmission. One way is to receive the base station signal after being amplified and transmitted to the mobile station. The other way is to receive the mobile station signal after being amplified and transmitted to the base station. Therefore, the composition of the RF two-way amplifier is mainly to receive Machine, transmitter, antenna.
