This type of repeater belongs to the same frequency digital amplification device, which refers to a radio transmission relay device that enhances the signal in the process of wireless communication transmission. By setting up a digital repeater, it can not only improve the coverage effect, but also greatly reduce the cost of investing in base stations.

The LTE wireless band selection digital repeater is a communication equipment designed and produced to eliminate the small-scale signal blind area or weak signal area of ??the LTE frequency band mobile communication network. It is widely used to eliminate the shadow area of ??outdoor local signal caused by the influence of high-rise buildings in the city or the weak signal area of ??individual villages and towns in remote suburbs.
